The coating and developing machine is an indispensable processing equipment in the chip manufacturing process. The robot is used to realize the transfer and processing of the wafer between various systems, and to achieve a perfect match with the lithography machine to complete the photoresist coating, curing, and development of the wafer And other processes. As the input of the lithography machine, that is, the photoresist coating before exposure and the output, which is the development of the pattern after exposure, the performance of the coating developer not only has a direct impact on the formation of fine exposure, but also the graphic quality and error control of the development process It also has a profound impact on the pattern transfer results in subsequent etching and ion implantation processes.
