In the production and use of coating machines, liquid chemicals or preparations used to remove dirt (such as grease, paint residue, ink, colloid, carbon deposits, dust, etc.) attached to the surface of the equipment, substrate or other materials. This cleaning agent uses the principles of chemical dissolution, complexation, emulsification, wetting, penetration, dispersion, solubilization, and stripping to ensure the cleanliness of the coating machine surface, thereby ensuring the smooth progress of the coating process and the stability of product quality.

With the widespread application of coating machines in electronics, new energy, printing and other industries, the market demand for coating machine cleaning agents is also growing. The requirements of these industries for product quality and production efficiency are constantly increasing, which has led to an increase in the demand for coating machine cleaning agents year by year. The increase in environmental awareness has led to an increasing demand for environmentally friendly coating machine cleaning agents in the market. Environmentally friendly cleaning agents have the characteristics of low toxicity, low residue, and easy degradation, which can better meet the requirements of environmental protection regulations and reduce pollution to the environment. Technological innovation is an important driving force for the development of the coating machine cleaning agent market. The research and development and application of new cleaning agents, such as water-based cleaning agents and biodegradable cleaning agents, continue to promote the progress and development of the market. These new cleaning agents have significant advantages in

cleaning effects, environmental performance and use costs. In summary, the coating machine cleaning agent market has broad development prospects and huge market potential.
