The global Coating Thickness Testers market size is predicted to grow from US$ 227 million in 2025 to US$ 342 million in 2031; it is expected to grow at a CAGR of 7.1% from 2025 to 2031.

The Coating Thickness Tester is an instrument for measuring the surface coating thickness on various substrates. To select a coating thickness gauge, we need to know the substrate first. Coating thickness gauges that can non-destructively measure the metal substrate or non-metal substrate are most widely used.

Paint thickness is an essential parameter that needs to be measured routinely. The proper film thickness has an impact on the paint opacity, appearance, and protective properties of the coating. Applying too much coating can also be detrimental that can lead to excessive drying time, cracking, and flaking of the paint film. Coating thickness measurement will monitor the paint process and maintain the appropriate coating properties.

Measuring the film thickness immediately after coating the surface is important to control the spreading rate and the final dry film thickness. Wet film thickness should be monitored frequently to maintain an efficient coating process. A wet film thickness gage is an inexpensive, easy to use device. They cover a wide wet film thickness range from industrial maintenance applications to thin coil coatings. Wet film gages can be used on virtually every substrate.

Paint thickness gauges for dry film thickness can either be a non-destructive

measurement or destructive measurement. The non-destructive paint gauge uses measurement principle of magnetic induction for ferrous substrates and eddy-current for non-ferrous substrates.

The generally accepted ratio of dry film to wet film thickness of most coatings is:

$$\text{Dry film} = \frac{\text{Wet Film x \% Volatile Solids of Coating}}{100}$$
