Amorphous Ribbon is a new soft magnetic material. It is produced through the advanced technology of rapid solidification of molten metal at a cooling rate of about a million $^{\circ}\text{C}/\text{sec}$. During this process the metal is rapidly quenched as a form of ribbon with 25-35 μm thickness, and the micro-structure of the alloy is the amorphous due to the high quenching rate.

Amorphous Ribbon has many advantages, such as high permeability, high saturate induction, high electrical resistivity, high density, low core loss and good stability. It can replace the materials of silicon steel, permalloy and ferrite. It is widely used in

electronics products that high accuracy and good stability are the most required.

According to regions, Japan dominated the entire market of the amorphous metal ribbons with about 39% of the global market share in 2019, much more than other regions.

From the different types of amorphous metal ribbons, the Iron-Based type held the maximum market share with over 70% in 2019.
