The coccidia virus live vaccine is a vaccine used to prevent coccidiosis in poultry, such as chickens. Coccidiosis, caused by *Eimeria* spp., is a parasitic infection that primarily affects the intestines of poultry, leading to diarrhea, weight loss, and even death. This vaccine uses attenuated live coccidia viruses to simulate an infection, stimulating the immune system to produce antibodies and enhancing the poultry's immunity against future coccidia infections. Compared to traditional coccidiostat treatments, the vaccine not only helps reduce the development of drug resistance but also improves poultry production performance, such as weight gain in broilers and egg production in layers, promoting a more sustainable and environmentally friendly poultry industry.
