The global Coconut Shell Activated Carbon for Gold Recovery market size is predicted to grow from US$ 219 million in 2025 to US$ 295 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Coconut shell activated carbon for gold recovery is a high-strength granular product manufactured from premium coconut shell charcoal through carbonization, steam activation, screening, and dedusting; it primarily adsorbs gold-cyanide complexes from cyanide leach solutions. Characterized by a well-developed microporous structure, high hardness, low attrition, minimal flaky particles, and excellent regeneration capabilities, the product is suitable for gold recovery processes such as CIP (Carbon-in-Pulp), CIL (Carbon-in-Leach), and CIC (Carbon-in-Column).

Upstream raw materials center on mature coconut shells and coconut shell charcoal, alongside activation steam, process water, and acid/alkali cleaning agents used for ash reduction and pH adjustment; the origin of the coconut shells, the degree of carbonization, and the raw material density directly influence the pore structure and mechanical strength of the finished product. Midstream processing involves carbonization, steam activation, crushing and sizing, screening, pre-attrition, dedusting, washing, and drying to produce granules with uniform particle size. Downstream applications are concentrated in gold mine cyanidation and extraction systems; after adsorbing gold-bearing complexes, the activated carbon proceeds to desorption, electrowinning, and smelting stages, and is recycled through acid washing and thermal regeneration.

In 2025, the global sales volume of coconut shell activated carbon for gold recovery is approximately 80,000 metric tons; the comprehensive price at the enterprise level
