The global Coercivity Measuring System market size is predicted to grow from US$ 149 million in 2025 to US$ 200 million in 2031; it is expected to grow at a CAGR of 5.1% from 2025 to 2031.

The coercivity measuring system is a device used to test the ability of materials, particularly magnetic materials, to retain their residual magnetism after the external magnetic field is removed. Coercivity describes a material's resistance to an opposing magnetic field, and it is typically determined by measuring the material's magnetization strength during the gradual decrease of the magnetic field. This measuring system is widely used in industries such as electronics, telecommunications, automotive, and energy, to assess the performance of permanent magnets and ferromagnetic materials, ensuring their stability and reliability in specific applications. The level of coercivity directly influences the material’s application scenarios. For instance, materials with high coercivity are suitable for applications that require stable magnetic fields, while low coercivity materials are more suited for applications where magnetization is easily reversible.

United States market for Coercivity Measuring System is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Coercivity Measuring System is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
