Abstracts

The global Coextruded Multilayered Film market size is predicted to grow from US\$ 1599 million in 2025 to US\$ 2094 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

In 2025, global coextruded multilayered film production reached approximately 454 kilotons, the average price is 3600 usd/ton. Coextruded multilayered films refer to plastic films or sheets with a layered structure produced by combining two or more different types of polymer melts in the same die or through a multi-channel die using a co-extrusion molding process, followed by simultaneous extrusion, cooling, and shaping. This technology aims to concentrate the superior properties of different polymers into a single film structure, achieving 'performance customization.'

Market Concentration and Major Players:

Internationally, the coextruded multilayered film market is highly concentrated, primarily in developed countries such as Europe, the US, and Japan. Large manufacturers include DIC Corporation and Versa Pak. Domestically, however, the coextruded multilayered film market still has significant room for growth.

Manufacturing Process and Market Trends:

The core of the coextruded multilayered film manufacturing process lies in the synergy of multiple extruders and precision die technology. Through multi-channel or feed block dies, polymer melts with different melt indices are combined at the exit, utilizing molecular diffusion between the melts to achieve interfacial metallurgical bonding, completely eliminating the need for adhesives required in traditional composites. During

production, the thickness of each layer is precisely controlled by an automatic die lip or feedback adjustment system, and rapid shaping on quenching rollers locks in the crystalline structure, which is crucial for maintaining the oxygen barrier properties of barrier layers such as EVOH. Furthermore, to accommodate the stacking of materials with high viscosity differences, advanced layer multiplication technology is widely used, making it possible to achieve microstructures with seven or even nine layers or more within a limited die space.

Market trends are moving towards both ultra-high barrier properties and extreme lightweighting. This is achieved by introducing nano-coatings or active fillers to enhance oxygen and moisture barrier properties, while simultaneously reducing overall thickness to lower unit area costs. Sustainable development is becoming the dominant direction, with renewable materials such as bio-based polyethylene and polylactic acid gradually being integrated into co-extrusion systems. Single-material co-extruded films are also gaining popularity due to their easy recyclability. Furthermore, digitalization is permeating the entire process, from online defect detection to adaptive thickness adjustment, significantly improving product consistency and yield to meet increasingly stringent safety standards for pharmaceutical and high-end food packaging.
