Coffee bag degassing valve is a one-way exhaust valve installed on coffee packaging bags. It is specially designed for freshly roasted coffee beans or coffee powder. Its main function is to allow the gas (such as carbon dioxide) in the bag to be discharged after the package is sealed, while preventing external air and water vapor from entering the package. Freshly roasted coffee will continue to release gas within a few hours to a few days. If there is no exhaust channel, it will easily cause the package to swell or even rupture; once air enters, it will accelerate the oxidation of the coffee and the loss of flavor. Coffee bag degassing valves achieve pressure-triggered exhaust through precise diaphragms or mechanical structures, taking into account both anti-swelling and fresh-keeping functions. They are widely used in mid-to-high-end coffee bean products and are an indispensable part of modern coffee packaging technology.
