Coincidence Counter is an electronic device used to detect and count events that overlap (i.e., occur simultaneously) in two or more input signals, and is widely applied in fields such as physics, chemistry, and biomedicine. It identifies signals that arrive almost simultaneously by comparing the time characteristics of multiple input signals, thereby achieving simultaneous measurement of events. The key characteristics that conform to a counter include time resolution (the ability to distinguish the minimum time intervals between signals) and counting capability (the ability to handle high counting rates), which can provide information on the correlation between input signals and reveal the interactions and associations within the system under test.

United States market for Coincidence Counter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
