The global Coke Dry Quenching System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Coke Dry Quenching (CDQ) is an advanced method used in the steel industry to cool hot coke (a byproduct of coal used in blast furnaces) without using water. In this system, the hot coke is transferred to a quenching chamber where it is cooled by an inert gas, usually nitrogen, instead of water. This process recovers the heat from the hot coke and uses it to generate steam, which can be utilized for power generation or other industrial purposes. CDQ offers several benefits over traditional wet quenching, including reduced water consumption, lower emissions of pollutants like particulate matter and greenhouse gases, and improved quality of the coke. By enhancing energy efficiency and reducing environmental impact, CDQ is a more sustainable option for the steel production process.
