According to our LPI (LP Information) latest study, the global Cold Cathode X-ray Tubes market size was valued at US\$ million in 2023. With growing demand in downstream market, the Cold Cathode X-ray Tubes is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Cold Cathode X-ray Tubes market. Cold Cathode X-ray Tubes are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Cold Cathode X-ray Tubes. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Cold Cathode X-ray Tubes market.

Traditional X-ray tubes are known as thermionic tubes. These tubes employ one or more filaments, similar to an incandescent light bulb, which are often made of tungsten. To produce tube current this filament is heated to in excess of 1000 °C, liberating the electrons needed for X-ray production in a process of Thermionic Emission. This “boiling off” of electrons is very inefficient as the energy is mostly wasted in heating up the filaments. The repetitive heating and cooling of the filament for X-ray exposures is not necessary with a Carbon Nano-tube (CNT) field emitter, which is driven by an applied electric field, not by temperature, and is thus known as a ‘cold cathode.’ Thermionic tubes are also comparatively hard to control since the current in the tube is changed only by changing the temperature of the emitter. In a CNT, the current is exactly and instantaneously controlled by an applied voltage.
