The cold extrusion double-action forming hydraulic press is a hydraulic device that uses a mold to apply a certain amount of pressure to the metal to cause the metal to undergo plastic deformation, thereby obtaining parts of the desired shape and size. This type of equipment usually has a double-action function, that is, it can control the two working cylinders to work simultaneously or separately to achieve a more complex forming process. The working principle of the cold extrusion double-action forming hydraulic press is mainly based on the principle of hydraulic transmission. The equipment is powered by a hydraulic system to inject high-pressure liquid into the main cylinder, causing the piston to generate a huge thrust. This thrust is transmitted to the metal blank through the mold, causing it to undergo plastic deformation, thereby achieving the forming of the part. In double-action mode, the equipment can control the two working cylinders to work separately or simultaneously to achieve different forming process requirements.

United States market for Cold Evaporative Humidifier is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
