## Abstracts

The global Cold Formed Parts market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Cold Formed Parts are parts produced through processes known as cold heading, or impact extrusion, which are both types of cold forming. Cold forming is a manufacturing process, where a metal blank is shaped into a part by using various types of presses. This is a unique parts manufacturing process that results in no loss of material, which saves a significant amount of money. The basic cold forming process uses a simple metal blank that is cut from solid wire or bar stock, then placed in a punch and die set that is mounted on a vertical, mechanical or hydraulic press. Then the metal blank is simply pressed into the desired shape using extreme pressure. The mechanical force of the punch causes the metal to literally “flow” around the punch and take the shape of the die. Since this process is performed at room temperature, with no heat applied to the metal blank, the process is called “cold forming” and the parts produced are referred to as “cold formed parts.”

**Lightweight demand:** The cold forming process can deform metal materials at room temperature, thereby producing net-shape or near-net-shape parts and reducing material waste. This process is particularly suitable for manufacturing automotive parts that require high strength but light weight, such as engine mounts, chassis components, etc.

**Efficient production:** The cold forming process usually uses equipment such as multi-station cold heading machines or cold head machines. These equipment can complete multiple processes in one station, significantly improving production efficiency. For mass-produced parts, the cold forming process offers significant cost advantages.
