Cold In-place Recycling (CIR) equipment is used in road construction and maintenance to rehabilitate existing asphalt pavements by recycling the materials in-place without the need for extensive excavation. CIR equipment typically involves a train of machinery that performs several key functions, including milling or pulverizing the existing pavement surface, adding recycling agents or rejuvenators to improve the properties of the recycled material, mixing the recycled material with new asphalt binder or emulsion, and compacting the mixture back into a durable and smooth pavement surface. This process effectively restores the structural integrity and ride quality of deteriorated pavements while reducing material waste, energy consumption, and greenhouse gas emissions compared to traditional methods of pavement rehabilitation.

The global Cold In-place Recycling (CIR) Equipment market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
