Cold Junction Compensation is a technique used in temperature measurement systems to correct for the effects of temperature variations at the Cold Junction, which is the point where the temperature-measuring probe (e.g., thermocouple or resistance temperature detector) is connected to the measuring instrument. When a temperature probe is used, the Cold Junction temperature can differ from the reference temperature (usually the ambient temperature), leading to measurement errors. Cold Junction Compensation involves measuring and accounting for this temperature difference to ensure accurate temperature readings.

The global Cold Junction Compensation market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
