A Cold Plate Loop is a type of cooling system designed to manage heat dissipation from electronic devices or components by using a cold plate and a closed-loop fluid circulation system. The cold plate is a metal plate, often made of copper or aluminum, that is attached to the heat-generating component (such as a processor, power semiconductor, or laser diode) and transfers the heat to a circulating coolant. The coolant absorbs the heat and then carries it away to a heat exchanger or radiator, where the heat is released into the environment.
