Collagen-stimulating fillers are a type of dermal filler used in cosmetic and aesthetic medicine to restore volume to the skin and stimulate the body's natural collagen production. Unlike traditional fillers that primarily add volume through hyaluronic acid or other substances, collagen-stimulating fillers work by promoting the production of collagen, a protein that contributes to the skin's firmness and elasticity.

Collagen-stimulating fillers typically contain biocompatible materials that stimulate the skin to produce new collagen. These materials often include substances like polylactic acid or calcium hydroxylapatite.

The main objective of collagen-stimulating fillers is to trigger the body's collagen

production process. When injected into the skin, these fillers stimulate fibroblasts, the cells responsible for collagen synthesis, to produce new collagen. The effects of collagen-stimulating fillers are gradual and progressive, as they rely on the body's natural collagen production. Over time, the treated area gradually improves in volume and texture.
