The report requires updating with new data and is sent in 48 hours after order is placed.

Colloidal gold is gold particles of a certain size that are polymerized into gold ions of a certain size after the reduction of gold ions by chloroauric acid (HAuCl_4) under the action of reducing agents such as white phosphorus, ascorbic acid, sodium citrate, and tannic acid. The crystal nucleus (icosahedron formed by 11 gold atoms) and the surrounding double ion layer (the inner layer is the negative ion layer AuCl_2^- , the outer layer is the positively charged H^+). Due to the electrostatic effect, the gold particles repel each other and suspend into a stable colloidal state, forming a negatively charged hydrophobic glue solution, so it is called colloidal gold. Colloidal gold has high electron density and can be combined with a variety of biological macromolecules. It has become a non-radioactive tracer commonly used in immunolabeling technology after fluorescein, radioisotopes and enzymes.

Colloidal gold immunochromatography products mainly include drug and drug detection test strips & kits, infectious disease detection test strips & kits, cardiac marker detection test strips & kits, tumor marker detection test strips & kits, etc.
