The global Color E-ink Screen Module market size is predicted to grow from US\$ 1323 million in 2025 to US\$ 3510 million in 2032; it is expected to grow at a CAGR of 15.0% from 2026 to 2032.

A color e-ink screen refers to a display module that uses color electronic ink display technology, serving as the core display component for integration into terminal products such as electronic price tags, electronic paper advertising displays, color e-readers, and e-notebooks. It features low power consumption, image retention when powered off, paper-like display, and outdoor readability, with wide applications across various scenarios. In 2025, the global shipment of color e-ink screen modules is expected to be approximately 200 million units.

The color e-ink screen module market as a whole is still in a high-growth but relatively niche stage. Its core growth comes from retail electronic price tags, electronic posters, in-store advertising displays, and low-power public information displays, with electronic price tags being one of the main applications. Growth is primarily driven by retail digitalization and the demand for low-power alternatives to paper signage. Small three-color price tag modules typically cost a few dollars up to 20?30 USD; color modules around 7 inches cost approximately 60?80 USD; 13.3-inch full-color modules cost about 270?300 USD; and large commercial color e-paper modules over 25 inches usually range from 1,000?1,500 USD or higher.

Technologically, E Ink remains the dominant core technology, and color e-paper such as Spectra 6 has already been used in retail signage, posters, and in-store advertising scenarios. Color e-ink screens are suitable as professional display components for low-power, long standby, high outdoor readability, and low-refresh-frequency scenarios.

Future growth will focus on retail, commercial displays, logistics labels, and public information signage. However, in the short term, the market is constrained by three factors: first, color display quality, refresh rates, and price are still less flexible than LCD/OLED; second, full-color/large-size modules are costly, so applications are mostly limited to static displays; third, the supply chain is relatively concentrated, with core materials and technologies dependent on a few companies.
