Color detection sensors are used for detecting the color of the surface and then cast light such as green, red, and blue LEDs on the objects to be tested, and to calculate the chromaticity coordinates from the reflected radiation and compare with previously stored reference colors. A color recognition channel allows the user to associate the specific characteristics of the target with the values stored in the sensor's internal memory. These sensors are useful in the monitoring of color consistency in areas such as packaging & printing, plastics, textile production, and other continuous output processes.
