A 'Column Heater' is a device or instrument used in chromatography to control and maintain the temperature of a chromatographic column during the separation process. Chromatography is a technique used for separating and analyzing components in a mixture based on their differential interactions with a stationary phase and a mobile phase. The column heater is specifically designed to provide precise temperature control for the chromatographic column, which is the main component of the chromatography system. It is typically a cylindrical or tubular device that surrounds the column and provides a controlled heating environment.

Column heaters are widely used in various industries, including pharmaceuticals, environmental analysis, petrochemicals, food and beverage, and research laboratories. They are essential tools for achieving reliable and high-quality separations in chromatographic processes.
