A Combined Cooling, Heating, and Power (CCHP) system—also known as trigeneration—is an energy-efficient technology that simultaneously produces electricity, heating, and cooling from a single fuel source, typically natural gas or biogas. By capturing and utilizing the waste heat generated during electricity production, CCHP systems significantly improve overall energy efficiency compared to separate systems. The recovered heat can be used for space heating, water heating, or converted into cooling energy via absorption chillers. Commonly used in hospitals, hotels, universities, and industrial facilities, CCHP systems help reduce energy costs, lower greenhouse gas emissions, and enhance energy resilience.
