Combined Flow Cooling Tower is a highly efficient, energy-saving and environmentally friendly cooling equipment, and its design concept and manufacturing process are all based on advanced technology. Combined Flow Cooling Tower adopts a design in which spray water and wind direction are combined. The wind is divided into two paths, one part of the cold wind enters vertically from the top, and the other part enters horizontally from the side. The temperature of the spray water is reduced by cross-heat exchange between the filler and the falling spray water. The water droplets brought out by the wind flow are blocked by the side water collector and drip into the lower water tank for recycling. The full integration of spray water and cold wind achieves cooling and temperature reduction, which fully reduces the temperature and is closer to the wet bulb temperature.

The global Combined Flow Cooling Tower market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
