The global Combined Worm Gear market size is predicted to grow from US$ 413 million in 2025 to US$ 600 million in 2031; it is expected to grow at a CAGR of 6.4% from 2025 to 2031.

A combined worm gear is a mechanical transmission device that combines two elements, a worm wheel and a worm, to achieve power transmission and torque conversion. The worm gear transmission drives the worm wheel through the rotation of the worm. Its unique gear meshing method can achieve a higher reduction ratio and is often used to reduce speed, increase torque and achieve precise transmission. Unlike traditional single-structure worm gears, combined worm gears are usually more compact in design and can integrate multiple functional modules, such as couplings, brakes, input shafts or output flanges, making them suitable for complex industrial scenarios.

United States market for Combined Worm Gear is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
