Abstracts

The global Combustible Dust Testing market size is predicted to grow from US\$ 472 million in 2025 to US\$ 711 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Combustible Dust Testing refers to a systematic set of laboratory and field evaluations designed to determine the fire, explosion, and deflagration hazards of particulate materials (dusts) when suspended in air or accumulated in large quantities. It is a critical safety practice for industries handling powdered substances (e.g., chemicals, food, pharmaceuticals, metals) to comply with regulatory standards, prevent accidents, and protect personnel/equipment.

Combustible dust is defined as fine particles (typically 420 microns)

Micro-Dust (100–420 microns)

Nano-Dust (
