Combustion degreasing furnace is a mechanical device that uses heating method to volatilize and burn the grease on the surface of the workpiece to remove it. Combustion-type degreasing furnace can be combined with carburizing furnace (or nitriding furnace) to form a combined machine, and the combustible waste gas discharged from the carburizing furnace is used as the heat source of the degreasing furnace. After the workpiece passes through the degreasing furnace, it enters the carburizing furnace to clean the surface and increase the carburizing capacity.
