The global Combustion Ion Chromatography System market size is predicted to grow from US$ 87.12 million in 2025 to US$ 120 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

A Combustion Ion Chromatography (CIC) system is an advanced analytical instrument that combines combustion and ion chromatography to detect and quantify halogens (such as fluorine, chlorine, bromine, and iodine) and sulfur in solid, liquid, or gaseous samples. The system first combusts the sample in an oxygen-rich environment at high temperatures, converting bound halogens and sulfur into ionic forms (e.g., HF, HCl, SO?). These combustion gases are then absorbed in a solution and analyzed using ion chromatography, which separates and quantifies the individual ions. CIC is widely used in environmental testing, materials screening, electronics manufacturing (for detecting halogen-free components), and compliance with regulations like RoHS and WEEE.

The market for Combustion Ion Chromatography (CIC) systems is experiencing steady growth driven by increasing demand for precise and reliable analysis of ionized compounds in complex matrices across various industries. CIC technology is valued for its ability to combine combustion with ion chromatography, enabling accurate quantification of elemental halogens, sulfur, nitrogen, and other compounds in environmental, pharmaceutical, and food safety applications. Advances in automation, sensitivity, and data processing have expanded its adoption in quality control, regulatory compliance, and research laboratories. Additionally, growing environmental monitoring regulations and the need for detailed material characterization fuel interest in CIC systems. The market is characterized by continuous innovation, with manufacturers focusing on enhancing throughput, ease of use, and integration capabilities to meet evolving customer requirements.
