Airplane Wheels are an important component of a landing gear system. With tires mounted upon them, they support the entire weight of the airplane during taxi, takeoff, and landing. The typical airplane wheel is lightweight, strong, and made from aluminum alloy. Some magnesium alloy wheels also exist. Early airplane wheels were of single piece construction, much the same as the modern automobile wheel. As airplane tires were improved for the purpose they serve, they were made stiffer to better absorb the forces of landing without blowing out or separating from the rim.
