The report requires updating with new data and is sent in 48 hours after order is placed.

The global Commercial Code market size is predicted to grow from US\$ 58780 million in 2025 to US\$ 171210 million in 2031; it is expected to grow at a CAGR of 19.5% from 2025 to 2031.

The commercial code is used to protect the financial level of the trade secret, the technology is not necessarily lower than the general secret, but the degree of management of commercial code products is not as high as the general secret, the application of more products, wide applications (such as VPN). The state provides that commercial passwords prohibit the operation of any security information above state secrets.

With the implementation of the Cryptography Law and the increasing attention paid to domestic cryptography, the performance requirements of underlying chips, boards, and devices are expected to continue to increase, and the 'high-quality upgrade' of domestic cryptography has become the need of the times. At the same time, cryptography is also an indispensable part of the construction of information and innovation. We believe that information and innovation are expected to become an important incision for the transformation of national cryptography, and the batch launch of national cryptography transformation business in 2022 is basically consistent with the pace of information and innovation promotion in key industries. At the same time, referring to the upgrade trend of cryptographic evaluation compliance documents in recent years, information and innovation compliance is expected to accelerate in the future, and national cryptography transformation may be promoted at the same frequency as information and innovation in the party and government and various industries.

However, the transformation of national cryptography also faces some challenges. In terms of technology, some domestic cryptographic products still have gaps in performance and compatibility with similar foreign products, which need further optimization and improvement. In terms of cost investment, the transformation of national cryptography involves multiple links such as hardware updates, software upgrades, and personnel training, which requires a lot of financial support. Talent shortage is also a prominent problem. There is a relative shortage of professional talents in domestic cryptography technology and application, which limits the progress and effect of the transformation. In response to these challenges, enterprises can strengthen cooperation with scientific research institutions to jointly overcome technical difficulties; the government can introduce relevant policies, provide certain financial subsidies and tax incentives to reduce the burden on enterprises; at the same time, increase talent training efforts, and cultivate more domestic cryptographic professionals through various means such as college education and vocational training.

Different industries have significant characteristics and differences in data security needs. The financial industry has extremely high requirements for data confidentiality and integrity, and any data leakage may lead to serious economic losses and unknown risks. The medical industry is more concerned about the privacy protection of patient data to ensure that patients' personal information is not abused. The manufacturing industry needs to protect intellectual property rights and trade secrets to prevent competitors from obtaining key production data. In response to these differences, the application of commercial cryptographic technology needs to be customized and developed and deployed according to industry characteristics to meet the specific needs of different industries

Cloud cryptographic construction and service models are becoming more mature and have become the mainstream of commercial cryptographic transformation

In recent years, the cloud cryptographic service market has shown steady growth, mainly benefiting from digital transformation and the emphasis on enterprise data security. The development trend of cloud cryptography technology shows the characteristics of continuous expansion of market scale, policies and regulations promoting security investment, artificial intelligence assisting security protection, unified management in multi-cloud environment, blockchain technology application, quantum computing and cloud cryptography technology, edge computing and cloud cryptography, and compliance and audit requirements. According to IDC and other institutions, the cloud password management market is expected to continue to expand

by 2025. Cloud cryptography service is a new cryptographic function delivery model. Users no longer 'buy' cryptographic products such as cryptographic hardware or cryptographic systems, but use cryptographic functions in a 'rental' manner. We believe that cloud cryptography service is not only a new business model, but also puts forward new requirements and challenges for cryptographic technology, and will even bring new development directions for cryptographic technology.
