The global Commercial Electric Cooker market size is predicted to grow from US\$ 651 million in 2025 to US\$ 1027 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

A Commercial Electric Cooker is a large-capacity electrically heated cooking vessel used in professional kitchens, institutional catering, central kitchens, hospitals, schools, and selected food-processing environments for batch preparation tasks such as boiling, simmering, braising, poaching, stewing, sauce reduction, and other controlled wet-cooking or mixed cooking operations. The equipment is commonly built as a cylindrical or rectangular stainless-steel vessel in countertop, freestanding, wall-mounted, or tilting configurations. A typical unit consists of a cooking pan or jacketed vessel, electric heating elements, insulation, a temperature control or programmable control system, a lid, discharge or tilting mechanism, water inlet, frame or cabinet base, and multiple safety components such as overheat protection and dry-run prevention. Its working principle is based on electrically generated heat being transferred directly through the cooking surface or indirectly through a heated jacket, enabling uniform and controllable thermal processing of large food volumes. Key technical requirements include heating efficiency, temperature uniformity, hygienic design, structural durability, food-contact safety, electrical reliability, easy cleaning, and stable performance during repeated batch operation.

From the perspective of market opportunities and main driving factors, the Commercial Electric Cooker segment is primarily supported by the electrification of commercial kitchens and by the continued expansion of centralized and standardized food production. Institutional kitchens, schools, hospitals, contract catering operators, central kitchens, and prepared-food facilities are increasingly focused on energy transition,

kitchen heat reduction, operational safety, and process consistency, which gives electrically heated cooking vessels a stronger position in new-build and retrofit projects. Products such as Electrolux Professional's electric boiling pans, Fagor Industrial's high-production boiling pans, Nayati's tilting boiling pans, and substitute intelligent systems like RATIONAL iVario Pro all emphasize output, temperature precision, even heating, and multifunctionality. This indicates that the market value proposition has shifted from basic cooking capability toward repeatability, labor efficiency, and menu consistency. For end users, these units are especially valuable in soups, sauces, porridge, braised products, and mass-catering operations, making them not simply a cookware substitute but a standardized batch-cooking platform.

From the perspective of challenges, risks, and restraints, this category also reflects the realities of a mature equipment market. Units are expensive, require planning and infrastructure, and depend on electrical capacity and kitchen layout, so demand is often tied to project budgets, renovation cycles, and institutional procurement rather than quick replacement buying. Although multifunctional, large-capacity electric boiling pans are not necessary for every foodservice format, and many smaller restaurants will continue to prioritize smaller electric cooklines or combi ovens. More importantly, the real barrier to competition lies not in making a heated vessel, but in achieving heat uniformity, jacketed heating control, electrical reliability, safe tilting or discharge structures, hygienic engineering, and long service life under continuous use. Public product materials from Electrolux, Fagor, and RATIONAL emphasize pressure performance, uniform heating, energy savings, programmability, and easy cleaning, showing that premium competition has moved well beyond basic hardware into process control and operational efficiency. Suppliers lacking strong control systems, hygienic engineering, and project-delivery capability will struggle to compete sustainably.

From the perspective of downstream demand trends, the next phase of development is unlikely to be driven only by larger capacities. Instead, the market is moving along three main directions. The first is automation and intelligent cooking control, including programmed cooking cycles, temperature profiling, automatic water handling, motorized tilting, pressure control, and recipe repeatability, all of which are already visible in advanced electric boiling pans and in systems such as iVario Pro. The second is energy transition and efficiency improvement, with electrically powered systems benefiting from decarbonization goals, building electrification, and the need for cooler kitchen environments. The third is expansion into food-processing-adjacent applications, where electric boiling pans are increasingly used not just as kitchen appliances but as standardized thermal-processing units for soups, sauces, deli foods, vegetables, and prepared meals. In this sense, the strongest manufacturers will be those capable of

integrating vessel design, controls, hygiene, repeatable cooking logic, and engineering support into a complete system rather than offering only a stand-alone machine.
