Micro CHP (Combined Heat and Power) systems are small-scale power generation units that produce both electricity and heat for use in buildings. These systems are also known as cogeneration systems and typically generate electricity through the combustion of natural gas, propane, or other fuels.

The heat produced during the electricity generation process is captured and used for space heating, hot water production, or other heating applications. This makes Micro CHP systems more energy-efficient than traditional power generation methods that produce electricity and waste heat separately.

The European Cogeneration Directive defines micro-CHP as all units with an electrical capacity of less than 50 kW.

Micro Combined Heat and Power (CHP) systems can be used in commercial applications, such as hotels, hospitals, offices, and other small to medium-sized buildings. Micro CHP systems can be an attractive option for commercial buildings looking to reduce their energy costs, increase their energy efficiency, and improve their energy independence.

The global Commercial Micro CHP Systems market size is projected to grow from US\$ 37.9 million in 2024 to US\$ 63.8 million in 2030; it is expected to grow at a CAGR of 9.1% from 2024 to 2030.
