Common-mode electromagnetic interference (EMI) mode suppression inductor is an inductor device used to suppress common-mode electromagnetic interference in circuits. Common mode interference refers to electromagnetic interference signals introduced into two wires of a circuit at the same time. It can interfere with the normal operation of electronic equipment, reduce the performance of the equipment, and even damage the equipment. The function of the common-mode EMI mode suppression inductor is to suppress this common-mode interference to ensure the normal operation of electronic equipment. With the increase in 5G communications and high-frequency RF applications, common-mode EMI mode suppression inductors need to operate in a

higher frequency range, so higher frequency response and lower losses will be required. Future trends will include the miniaturization and integration of common-mode EMI mode suppression inductors to meet the needs of compact electronic equipment and reduce space requirements.
