The common optical path interferometer is a type of interferometer, which is characterized by the fact that the reference beam and the sample beam propagate along the same path. This design makes the common optical path interferometer have strong anti-interference ability in terms of environmental vibration, temperature, and airflow changes, and usually stable interference fringes can be obtained without vibration isolation and constant temperature conditions. The working principle of the common optical path interferometer is based on the interference principle of waves, that is, the superposition of waves is used to obtain the phase information of the waves, so as to further obtain the physical quantity of interest in the experiment. In the common optical path interferometer, the reference beam and the measuring beam pass through the same optical path, and their phase difference will be affected by various factors on the common path, such as changes in path length or changes in refractive index on the path. By measuring the changes in interference fringes caused by these phase differences, the physical quantity of interest can be inferred. The common optical path interferometer has many advantages, such as no need for a reference surface with the same size as the measured surface, and even in some common optical path interferometer, no special reference surface is required. The reference beam comes directly from a tiny area of the measured surface (or system). This design gives the common optical path interferometer a unique advantage in measuring surface defects, flatness, etc. In addition, since the reference beam and the measuring beam pass through the same optical path, they can produce common mode suppression of each other to environmental vibration, temperature, airflow changes, etc., thereby improving the stability and accuracy of the measurement.

The global Common Optical Path Interferometer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
