A communication reconnaissance receiver is a receiving device specially used to detect the radiation signals of the other party's electronic equipment. The communication reconnaissance receiver is mainly composed of an antenna, a receiving device, a terminal device, a power supply and a matching electronic computer. These components work together to detect, intercept, identify and analyze the radiation signals of the enemy's electronic equipment. Communication reconnaissance receivers are widely used in the military field and are one of the important means of electronic countermeasures and intelligence reconnaissance. By detecting enemy communication signals, it is possible to determine important information such as the enemy's troop deployment, command system configuration, and number of communication network stations, providing a basis for formulating electronic countermeasure combat plans, implementing interference and guiding firepower destruction.

United States market for Communication Reconnaissance Receiver is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Communication Reconnaissance Receiver is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
