Compact aluminum-clad steel stranded wire is a high-strength, high-conductivity composite conductor, which is made of several aluminum-clad steel single wires tightly twisted according to a specific structure. Its core structure is a steel wire core, which is covered with a layer of high-purity aluminum. A good conductive layer is formed through metallurgical bonding, which not only retains the high mechanical strength of the steel core, but also has the excellent conductivity and corrosion resistance of aluminum. Compared with traditional stranded wires, compact aluminum-clad steel stranded wire has a smaller diameter and higher line density utilization under the same cross-section, which can effectively reduce line wind resistance and power loss, improve line stability and transmission efficiency, and is widely used in ultra-high voltage and UHV transmission lines, cross-sea and cross-river large-span projects and other transmission scenarios with high requirements for strength, stability and corrosion resistance. It is a key high-performance conductor material in modern power transmission systems.

United States market for Compact Aluminum Clad Steel Stranded Wire is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
