The global Compact Autocorrelator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An autocorrelator is used to measure the pulse duration. The basic principle is to use a beam splitter to create two copies of the incoming beam. These copies are superimposed in a nonlinear medium, where they interact to produce a third beam. Since the overlap of the two copies depends on the pulse duration, analysis of the third beam allows calculation of the pulse duration. The compact autocorrelator is very compact and very easy to use. Measure in just two minutes!
