The global Composite Current Collector Materials market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Composite current collector materials are current collectors made of multiple materials through a composite process, usually including a composite structure of a metal substrate (such as aluminum foil, copper foil) and functional layers such as conductive polymers and carbon materials. Its purpose is to improve the conductivity, corrosion resistance, mechanical strength and lightweight performance of the current collector in the battery. It is widely used in lithium batteries, electric vehicles, energy storage equipment and other fields to improve the energy density, power output and cycle life of the battery.

The emergence of composite current collector materials marks the innovation and progress of battery technology. By composite functional materials on traditional metal current collectors, the battery has achieved significant improvements in conductivity, lightness and corrosion resistance. This type of material can not only enhance the energy density and power performance of the battery, but also effectively extend the service life of the battery, meeting the needs of electric vehicles, energy storage systems and consumer electronics for high-efficiency batteries. In the context of the global new energy transformation, composite current collector materials will undoubtedly become an important driving force for the development of battery technology.
