## Abstracts

The global Composite Films for Aerospace market size is predicted to grow from US\$ 2726 million in 2025 to US\$ 4297 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

Composite films for aerospace refer to high-performance multilayer or reinforced polymer films engineered for use in aircraft structures, electrical insulation systems, and protective layers in aerospace applications. These films typically combine advanced polymers such as polyimide, polyether ether ketone (PEEK), fluoropolymers, or polyester with reinforcing fibers, coatings, or laminated layers to achieve properties including high temperature resistance, flame retardancy, chemical stability, electrical insulation, and low weight. Aerospace composite films are used in aircraft electrical insulation, thermal protection systems, composite laminate structures, interior panels, and wire harness protection. Compared with conventional polymer films, aerospace-grade composite films must meet stringent standards for flammability, smoke toxicity, and mechanical durability under extreme environmental conditions. From a value chain perspective, upstream includes high-performance polymer resins, reinforcing fibers, specialty additives, coating materials, and precision film extrusion equipment; midstream involves polymer compounding, multilayer film extrusion, lamination, coating processes, precision slitting, and aerospace certification testing; downstream demand comes from aircraft manufacturers, aerospace component suppliers, avionics system manufacturers, and maintenance, repair, and overhaul (MRO) service providers. In 2025, the average selling price of aerospace composite films is approximately US\$86 per kilogram, with global demand reaching around 32,400 tons. The industry maintains a gross margin of 32%–48%, supported by strict aerospace certification standards, specialized materials engineering, and long product qualification cycles.

The aerospace composite film market is growing as aircraft manufacturers increasingly adopt lightweight materials to improve fuel efficiency and reduce emissions. High-performance polymer films such as polyimide and PEEK are gaining importance due to their ability to withstand extreme temperatures and harsh chemical environments in aerospace systems. In addition, the electrification of aircraft subsystems and the increasing complexity of avionics systems are driving demand for advanced electrical insulation films. Manufacturers are also focusing on developing films with improved flame retardancy, low smoke emission, and enhanced durability to meet evolving aerospace safety standards.
