The composite mode filler refers to the combination of two or more types of packing to provide a wider range of separation capabilities and selectivities. The composite mode filler combines the characteristics of different types of packing materials, and can realize multiple separation mechanisms in the same chromatographic column, so as to realize more complicated sample separation.

The use of composite mode fillers can make full use of the advantages of different types of fillers and make up for the shortcomings of various fillers used alone. The choice of multimodal packing depends on the nature of the sample and the target to be

separated. It can provide wider selectivity and higher separation efficiency, providing an important tool for the separation and purification of complex samples.
