The global Composite Self-lubricated Bearing market size is predicted to grow from US$ 3894 million in 2025 to US$ 6516 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

Composite Self-lubricated Bearing is an advanced and innovative type of bearing. It is fabricated by combining multiple materials with distinct properties. The matrix material provides excellent load-bearing capacity, while the incorporated additives or lubricating phases endow it with self-lubricating characteristics. During operation, it doesn't require additional lubricating oil or grease. Thanks to its internal special lubricating components, it can effectively reduce the friction coefficient and minimize wear. Even under extreme conditions such as high speed, heavy load, low temperature, or vacuum, it can maintain a stable working state, which significantly extends its service life and cuts down maintenance costs.

United States market for Composite Self-lubricated Bearing is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
