Composite structures for phone refer to the internal structural components of mobile phones made of composite materials. These components play a vital role in mobile phones, such as supporting, protecting and connecting other parts inside the mobile phone. Composite materials, usually composed of two or more materials of different properties, have the advantages of light weight, high strength, corrosion resistance and wear resistance, so they are very suitable for manufacturing mobile phone structural parts.

Compared with traditional metal materials, composite structure not only have better physical properties, such as higher strength and toughness, but also provide better electromagnetic shielding effect, which helps to improve the signal quality and stability of mobile phones. In addition, the lightweight characteristics of composite materials also help to reduce the overall weight of mobile phones and improve the user experience.

In general, composite structures for phone are an important part of modern mobile phone manufacturing. They not only improve the physical performance and signal quality of mobile phones, but also improve the user's comfort through lightweight design.
