Compostable cling film is a type of packaging material designed to wrap and protect food items while being environmentally friendly. Made from biodegradable polymers such as polylactic acid (PLA), polyhydroxyalkanoates (PHA), starch-based materials, or cellulose, this film is engineered to decompose into natural substances in composting environments, either industrial or home composting systems. Compostable cling film provides similar functionality to traditional plastic cling film, including high clarity, good cling properties, and barrier protection against moisture and gases, but with the added benefit of reducing plastic waste and environmental impact by breaking down into compost instead of lingering in landfills. Development trends focus on enhancing the film's performance characteristics and expanding its applications to meet growing consumer and regulatory demands for sustainable packaging solutions.

The global Compostable Cling Film market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
