## Abstracts

The global Compostable Laminate Films market size is predicted to grow from US\$ 164 million in 2025 to US\$ 310 million in 2032; it is expected to grow at a CAGR of 9.7% from 2026 to 2032.

Compostable Laminate Films are multi-layered packaging materials designed to break down into natural elements under composting conditions, typically within a specified period. These films are composed of biodegradable materials, such as plant-based polymers or bio-plastics, that decompose through microbial activity, leaving no toxic residues. Compostable laminate films are engineered to provide the necessary barrier properties, such as moisture and oxygen resistance, while ensuring they can be safely returned to the environment as compost, supporting sustainability and reducing plastic waste.

Compostable Laminate Films are gaining increasing attention in the packaging industry as a sustainable alternative to conventional plastic laminates. These films are designed to provide the same protective and functional qualities as traditional laminates, such as moisture resistance, durability, and visual appeal, while being environmentally friendly. Derived from renewable plant-based sources, compostable laminate films are engineered to break down naturally in composting environments, leaving behind no toxic residues. Their application spans a wide range of sectors, including food packaging, personal care products, and printed materials, aligning with growing consumer demand and regulatory pressure for greener solutions. Research and development in this field continue to focus on enhancing the performance, shelf life, and compostability of these films to support the transition toward a more circular economy.
