A compression molding bonded magnet is a composite magnet made by mixing magnetic powders (such as NdFeB) with a polymer binder and then pressing the mixture into shape under high pressure. This process offers high magnetic performance, excellent dimensional stability, and good mechanical strength, while allowing the production of complex shapes. Unlike traditional sintered magnets, compression-molded bonded magnets do not require high-temperature sintering, reducing production costs and minimizing material oxidation loss. Additionally, their anisotropy can be controlled through magnetic field orientation to meet various application needs. These magnets are widely used in the automotive, electronics, motor, and sensor industries, especially in applications requiring high precision and mass production.
