Computerized rotation compensation equatorial mount is a mount for instruments that compensates for Earth's rotation by having one rotational axis, the polar axis, parallel to the Earth's axis of rotation. The motors also connect to an onboard computer. Once you run through a simple setup procedure, the go-to drive will find and then track your celestial target. This type of mount is used for astronomical telescopes and cameras.

The global Computerized Rotation Compensation Equatorial Mount market size is projected to grow from US\$ 61.6 million in 2024 to US\$ 75.4 million in 2030; it is expected to grow at a CAGR of 3.4% from 2024 to 2030.
