The global Computing Power Scheduling Platform market size is predicted to grow from US\$ 4586 million in 2025 to US\$ 13430 million in 2032; it is expected to grow at a CAGR of 16.9% from 2026 to 2032.

A computing power scheduling platform is a comprehensive management system for intelligently allocating, dynamically scheduling, and efficiently utilizing multi-source heterogeneous computing resources. This platform orchestrates and schedules diverse computing resources, including cloud computing, edge computing, GPUs, CPUs, and FPGAs, achieving optimal allocation and real-time scheduling based on task requirements, resource load, latency constraints, and energy optimization strategies. Computing power scheduling platforms typically integrate artificial intelligence (AI), big data, and automated operations and maintenance (O&M) technologies to support cross-regional and cross-architecture computing coordination and elastic scaling. They are widely used in scenarios such as AI training and inference, high-performance computing (HPC), cloud gaming, autonomous driving, and digital twins. They are critical infrastructure for enabling 'computing as a service' and the efficient operation of computing networks. Downstream applications of computing power scheduling platforms primarily include AI model training and inference, cloud computing services, scientific simulation, high-performance computing (HPC), video rendering, autonomous driving simulation, smart cities, financial risk management, and big data analytics. These industries have extremely high requirements for real-time scheduling of computing resources, task parallelization, and optimized resource utilization. Computing power scheduling platforms enable intelligent allocation and elastic scaling of multi-node and multi-type computing power (CPU, GPU, NPU, etc.), significantly reducing computing costs and improving task execution efficiency. Downstream customers primarily include internet companies, research institutions, government departments,

and large industrial groups. Their payment models primarily rely on computing power leasing, SaaS platform subscriptions, and the development of dedicated scheduling systems.

From a profitability perspective, computing power scheduling platforms represent a segment with high technical barriers and strong added-value services, resulting in an overall gross profit margin of approximately 53%.

With the rapid development of cloud computing, artificial intelligence, and big data applications, computing power scheduling platforms are becoming a key tool for enterprises and scientific research institutions to improve computing efficiency. Through intelligent resource scheduling, it breaks the geographical and environmental limitations of computing resources and realizes seamless collaboration of cloud, edge, and local computing. In the context of the current surge in computing power demand, computing power scheduling platforms can not only optimize resource utilization, but also reduce operating costs and delays, and promote enterprises to respond to complex computing needs more flexibly and efficiently in digital transformation. Therefore, computing power scheduling platforms will become an important part of future information technology infrastructure.
