Concrete armored joints refer to specialized construction elements used in concrete pavement to accommodate the natural expansion and contraction of the material due to temperature variations and other factors. These joints are designed to mitigate the potential damage caused by these movements, preventing cracking and ensuring the structural integrity of the pavement. Armored joints typically consist of steel or other durable materials embedded within the concrete, providing a reinforced connection between adjacent sections. The armored joint absorbs the stresses induced by thermal changes and load-bearing, reducing the risk of surface distress and enhancing the longevity and performance of the concrete pavement.
