The report requires updating with new data and is sent in 48 hours after order is placed.

The loader puts different aggregates into the batching station, automatically proportions and weighs them, and then mixes them with the cement in the cement silo. All the materials are then sent to the mixer. After mixing evenly, the belt conveyor conveys the materials to the block forming machine. The products formed after vibration and pressure are cleaned by the brick surface cleaner and then conveyed to the automatic plate lifter by the brick feeder. Afterwards, the sub-mother car will send all the products on the pallet to the curing kiln for curing. The cured products are then sent to the automatic lowering machine by the sub-mother car. The lowering machine lowers the products to the brick feeder and then enters the palletizing area for palletizing, and then transported by forklifts to the finished product yard for sale. The pallet is cleaned by the cleaner, and then returned to the molding machine for recycling after being turned over by the turning machine.
