## Abstracts

The global Conductive Masterbatch for Plastics market size is predicted to grow from US\$ 880 million in 2025 to US\$ 1491 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

Conductive Masterbatch for Plastics refers to a high-concentration additive compound in which conductive fillers are uniformly dispersed within a compatible thermoplastic carrier resin, specifically designed to provide electrical conductivity or static-dissipative properties to plastic products. The conductive fillers commonly include carbon black, carbon nanotubes (CNTs), graphene, metal powders, or hybrid conductive systems. During processing, the masterbatch is blended with base polymers such as polyethylene (PE), polypropylene (PP), polystyrene (PS), ABS, PVC, or engineering plastics through extrusion, injection molding, or blow molding. The conductive particles form a continuous conductive network inside the polymer matrix, reducing surface and volume resistivity and preventing electrostatic charge accumulation. In some formulations, it can also provide electromagnetic interference (EMI) shielding. Conductive masterbatch for plastics is widely used in anti-static packaging, electronic housings, automotive fuel system components, cable sheathing, industrial containers, and explosion-proof products. Key performance factors include resistivity control range, dispersion quality, processing stability, mechanical property retention, and compatibility with the host polymer system.

In 2025, global Conductive Masterbatch for Plastics production reached approximately 300 K MT, average price was 3000 USD/unit
